

# What is Shaping Data?

- **How do you know if data has realistic values?**
- **How do you know if data is the correct shape for mathematical operations?**
  - Shaping data!

# How can you reshape data?

- Python's NumPy package

- **Input data, layers of neurons, and output data come in arrays of various shapes**

- NumPy lets you reshape arrays

NumPy

- NumPy's ndarray type is a wrapped around Python's list type

NumPy

- NumPy's type is a decorator
- Provides extra methods for working with arrays

- **Shapes of arrays must be manipulated to work with some mathematical operations**
- **Some dimensions of matrices must match**

**What is Shaping  
Data? ✓**

**Let's  
begin...**
